There are many types of glass mirrors, each representing a different manufacturing process and reflection type. An aluminium glass mirror is made of a float glass manufactured using vacuum coating, i.e. aluminium powder is evaporated (or "sputtered") onto the exposed surface of the glass in a vacuum chamber and then coated with two or more layers of waterproof protective paint.

### **Mirror - Wikipedia**

Holography is the science and practice of making holograms. Typically, a hologram is a photographic recording of a light field, rather than of an image formed by a lens, and it is used to display a fully three-dimensional image of the holographed subject, which is seen without the aid of special glasses or other intermediate optics. The hologram itself is not an image and is usually ...

X-Ray Data Booklet Section 4.1 MULTILAYERS AND CRYSTALS. James H. Underwood (This section is also available as a PDF file.). A. MULTILAYERS. By means of modern vacuum deposition technology, structures consisting of alternating layers of high- and low-Z materials, with individual layers having thicknesses of the order of nanometers, can be fabricated on suitable substrates.

Geologists like me teach students and conduct research with microscopes called "polarizing" or "pol" for short. After development in the late 19th century, pol scopes became critical tools for studying the minerals and structures of rocks (our Earth), which can tell us much about how they formed.

These commands cannot be used in math mode. However, part of a formula may be set in a different size by using an mbox command containing the size command. The new size takes effect immediately after the size command; if an entire paragraph or unit is set in a certain size, the size command should include the blank line or the end {...} which delimits the unit.
